PROTEINS

- · Proteins are molecules made of amino acids
- · Amino acids are small molecules that form a flexible chain

- There are several degrees of freedom (black arrows)
- The purple dots represent the *side chains*, that is a sub molecule that depends on the amino acid type
- Each amino acid is given a letter code (typ., 20 types)

PROTEINS

SIMPLIFIED ATOMIC STRUCTURE

- The backbone (green) links consecutive amino acids
- Each amino acid is represented by its carbon alpha (C_{α})

= 900

PROTEINS BACKBONE

- We consider a backbone made of 4 amino acids.
- The distance between $C\alpha$ points is constant (3.81Å).

There are two bend angles

And one torsional angle

THE STRUCTURE PREDICTION PROBLEM

- Given the amino acid sequence
- For each amino acid, output its position in the space

THE STRUCTURE PREDICTION PROBLEM

... and this is the hard part:

- In nature a protein has a unique/stable 3D conformation
- A cost function (that mimics physics laws) can be used to score each conformation

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

• Searching for the optimal score produces the best candidate (NP-complete)

IDEA: FRAGMENT ASSEMBLY

- Too many random 3D conformations: focus on biologically meaningful ones
- Generation of conformations constrained by *local* homology
- Similar sub-sequences ⇔ similar shapes
- The shorter the sequence, the more typical behavior (set of most frequent conformations)
- Local shape (e.g., helices) depends more on local sequence
- Idea: enumeration of local shapes (fragment assembly)
- Combine local (statistical) preferences and build a coherent global conformation
- Assumption: nature prefers some local shapes ⇒ we should do it as well

ENRICHING THE MODEL

THE CENTROIDS

- Given a $C\alpha$ 4-tuple in 3D, a small degree of freedom for the position of the side chain is allowed
- Different amino acids have different occupation
- A pure Cα-Cα model does not keep into account these differencies
- We consider the positions of the centroids of the side chains.
- Roughly, a centroid is the expected center of mass of the side chain

PROTEIN STRUCTURE

CONCLUSIONS

ADVERTISING

ENRICHING THE MODEL THE CENTROIDS

(日) (日) (日) (日) (日) (日) (日)

CLP(FD) MODELING

- Given amino acid sequence: $[a_1, a_2, \ldots, a_n]$,
- Amino acid positions: $X_1^{\alpha}, Y_1^{\alpha}, Z_1^{\alpha}, \dots, X_n^{\alpha}, Y_n^{\alpha}, Z_n^{\alpha}, X_2^{c}, Y_2^{c}, Z_2^{c}, \dots, X_{n-1}^{c}, Y_{n-1}^{c}, Z_{n-1}^{c}$
- Domains: discretized (0.01Å) 3D positions.
- Fragments: $F_1, F_2, ..., F_{n-3}$.
- Domains: fragments ID from the library for $[a_i, a_{i+1}, a_{i+2}, a_{i+3}]$.
- Variables for rotation matrices: $R_1, R_2, \ldots, R_{n-3}$.

CLP(FD) MODELING FD constraints

- *F_i* and *F_{i+1}* can take only compatible assignments (described by *next*(*F_i*, *F_{i+1}*, *M_i*(*i*+1)))
- the constraint is posted using table builtin
- All fragments are stored in the same reference, thus need to rotate reference, while building the fragments:

(日) (日) (日) (日) (日) (日) (日)

• $R_{i+1} = M_{i,(i+1)} \cdot R_i$ implemented as a constraint

ADVERTISING

CLP(FD) MODELING FD constraints: link positions to fragments

- $Q_4 = R_{i+1} \cdot F_{i+1} + shift$ (*Ps* already placed = F_i)
- correct shift overlaps P_4 and Q_3 , so that distance between $(X_{i+3}^{\alpha}, Y_{i+3}^{\alpha}, Z_{i+3}^{\alpha})$ and $(X_{i+4}^{\alpha}, Y_{i+4}^{\alpha}, Z^{\alpha})$ is ~3.81Å.

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

CLP(FD) MODELING

DISTANCE CONSTRAINTS

For each i, j, introduce a distance var D_{i,i}

•
$$D_{i,j} = (X_i - X_j)^2 + (Y_i - Y_j)^2 + (Z_i - Z_j)^2$$

- $D_{i,i} \ge min_dist$ (all_distant) (*)
- *D_{i,i}* ≤ diameter² (compact_factor)
- If ssbond(i,j), $D_{i,j} \leq 6$ Å.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

CLP(FD) MODELING

DISTANCE CONSTRAINTS

• For each *i*, *j*, introduce a distance var *D*_{*i*,*i*}

•
$$D_{i,j} = (X_i - X_j)^2 + (Y_i - Y_j)^2 + (Z_i - Z_j)^2$$

- $D_{i,i} \ge min_dist$ (all_distant) (*)
- *D_{i,j}* ≤ diameter² (compact_factor)
- If ssbond(i,j), $D_{i,i} \leq 6$ Å.
- $D_{i,i} \leq 3.81 * |i j|$ (max stretch)
- Triangular inequality (over $D_{i,i}, D_{i,k}, D_{i,k}$)

(ロ) (同) (三) (三) (三) (三) (○) (○)

CLP(FD) MODELING COST FUNCTION

- Each conformation has four energy contributions:
- Contact centr–centr: each pair of centroid gives a contribution depending on distance and type.
- Contact $C\alpha$ - $C\alpha$: each pair of centroid gives a contribution depending on distance.
- Torsional: each torsion is scored according to a statistical profile for the local sequence.
- Torsional correlation: each pair of consecutive torsion angles is scored with a correlation contribution.
