Recently, many mathematicians have studied different kinds of the Euler, Bernoulli, and Genocchi numbers and polynomials. In this paper, we give another definition of polynomials $\tilde{C}_n(x)$. We observe an interesting phenomenon of “scattering” of the zeros of the polynomials $\tilde{C}_n(x)$ in complex plane. We find out some identities and properties related to polynomials $\tilde{C}_n(x)$. Finally, we also derive interesting relations between polynomials $\tilde{C}_n(x)$, Stirling numbers, central factorial numbers, and Euler numbers.

1. Introduction

Recently, many mathematicians have studied in the areas of the Bernoulli numbers and polynomials, Euler numbers and polynomials, Genocchi numbers and polynomials, Stirling numbers, and central factorial numbers (see [1–7]). These numbers and polynomials possess many interesting properties and are arising in many areas of mathematics and physics. In this paper, we give another definition of polynomials $\tilde{C}_n(x)$. We obtain some interesting identities and properties related to polynomials $\tilde{C}_n(x)$. In order to study the polynomials $\tilde{C}_n(x)$, we must understand the structure of the polynomials $\tilde{C}_n(x)$. Therefore, using computer, a realistic study for the polynomials $\tilde{C}_n(x)$ is very interesting. It is the aim of this paper to observe an interesting phenomenon of “scattering” of the zeros of the polynomials $\tilde{C}_n(x)$ in complex plane.

The Stirling numbers of the first kind $s(n,k)$ define that
\[
\sum_{k=0}^{n} s(n,k) x^k = x(x - 1)(x - 2)\cdots(x - n + 1). \tag{1}
\]

The generating function of (1) is as follows:
\[
(\log(1 + x))^n = k! \sum_{n=k}^{\infty} s(n,k) \frac{x^n}{n!}. \tag{2}
\]

From (1) and (2), we are aware of some properties of the Stirling numbers of the first kind $s(n,k)$ as follows (see [1, 2, 15]):
\[
s(n,k) = s(n-1,k-1) - (n-1)s(n-1,k), \tag{3}
\]

with
\[
s(n,0) = 0 \quad (n \in \mathbb{N}),
\]
\[
s(n,n) = 1 \quad (n \in \mathbb{Z}^+ = \mathbb{N} \cup \{0\}),
\]
\[
s(n,1) = (-1)^{n-1} (n-1)! \quad (n \in \mathbb{N}),
\]
\[
s(n,k) = 0 \quad (k > n \text{ or } k < 0).
\]

We usually define the central factorial numbers $T(n,k)$ as the following expansion formula (see [1, 7]):
\[
\sum_{k=0}^{n} T(n,k) x \left( x - 1 \right)^2 \left( x - 2 \right)^2 \cdots \left( x - (k-1)^2 \right) = x^n. \tag{5}
\]

The generating function of (5) is as follows:
\[
(e^x + e^{-x} - 2)^n = 2^{kn} \sum_{n=k}^{\infty} T(n,k) \frac{x^n}{(2n)!}. \tag{6}
\]
By using (5) and (6), we are aware of some properties of the central factorial numbers \( T(n, k) \) as follows:
\[
T(0, 0) = 1, \\
T(n, 0) = 0 \quad (n \in \mathbb{N}), \\
T(n, 1) = 1 \quad (n \in \mathbb{N}), \\
T(n, k) = T(n - 1, k - 1) + k^2 T(n - 1, k),
\] (7)
with
\[
T(n, 2) = \frac{1}{4} \left( 4^{n-1} - 1 \right), \\
T(n, 3) = \frac{2^n}{360} - \frac{4^n}{640} + \frac{1}{24} \quad (n \in \mathbb{N}).
\] (8)
The Euler numbers \( E_n \) are defined by the generating function:
\[
\frac{2}{e^x + 1} = \sum_{n=0}^{\infty} \frac{E_n}{n!} x^n.
\] (9)
We introduce the Euler polynomials \( \overline{U}_n(x) \) as follows:
\[
\left( \frac{2}{e^x + 1} \right) e^{\overline{U}_n(x)} = \sum_{n=0}^{\infty} \frac{E_n}{n!} x^n.
\] (10)
Zhi-Hong Sun introduces the sequence \([U_n] \) similar to Euler numbers as follows:
\[
U_0 = 1, \\
U_n = -2 \sum_{k=1}^{n/2} \binom{n}{2k} U_{n-2k} \quad (n \geq 1),
\] (11)
where \([x] \) is the greatest integer not exceeding \( x \) (see [4, 5]).

The outline of this paper is as follows. In Section 2, this paper is to define polynomials \( \overline{U}_n(x) \). In Section 3, we describe the beautiful zeros of the polynomials \( \overline{U}_n(x) \) using a numerical investigation. We investigate the roots of the polynomials \( \overline{U}_n(x) \). Also we carried out computer experiments for demonstrating a remarkably regular structure of the complex roots of the polynomials \( \overline{U}_n(x) \). In Section 4, we derive some special relations of polynomials \( \overline{U}_n(x) \) and Euler numbers.

2. Some Properties Involving a Certain Family of Numbers and Polynomials

In this section, we introduce the polynomials \( \overline{U}_n(x) \) and investigate some interesting properties and identities which are related to polynomials \( \overline{U}_n(x) \). We also try to find relations between polynomials \( \overline{U}_n(x) \), Stirling numbers \( s(n, k) \), and central factorial numbers \( T(n, k) \).

**Definition 1.** For \( x \in \mathbb{R} \) or \( \mathbb{C} \), the polynomials \( \overline{U}_n(x) \) are defined by
\[
\sum_{n=0}^{\infty} \frac{\overline{U}_n(x)}{n!} x^n = \left( \frac{1}{e^{x} + e^{-x}} - 1 \right) e^{x^n}.
\] (12)
From Definition 1, we have Theorem 2.

**Theorem 2.** Let \( n, k, l \in \mathbb{Z}^+ \) and \( n \geq k - l - 1 \). Then one obtains
\[
\overline{U}_n(x) = \sum_{k=0}^{2n} \sum_{j=0}^{n-k} \binom{2n}{j} (-1)^{j+k} T(n - j, j, k) x^k,
\]
\[
\overline{U}_{2n+1}(x) = \sum_{k=1}^{n+1} \sum_{j=0}^{n-k} \binom{2n+1}{j} (-1)^{j+k} T(n - j, j, k - (2j + 1)) x^k,
\] (13)
where \([x] \) is the greatest integer not exceeding \( x \) and \( \mathbb{Z}^+ = \mathbb{N} \cup \{0\} \).

**Proof.** By Definition 1, (2), and (6), we have
\[
\sum_{n=0}^{\infty} \frac{\overline{U}_n(x)}{n!} x^n = \sum_{n=0}^{\infty} \frac{E_n}{n!} x^n = \sum_{n=0}^{\infty} \frac{E_n}{n!} x^n.
\] (14)
From now on, we have to consider odd terms and even terms by using Cauchy product. So, we get to generating terms by dividing the odd terms and the even terms, respectively,
\[
\sum_{n=0}^{\infty} \frac{\overline{U}_n(x)}{n!} x^n = \sum_{n=0}^{\infty} \frac{\overline{U}_{2n}(x)}{(2n)!} x^{2n} + \sum_{n=0}^{\infty} \frac{\overline{U}_{2n+1}(x)}{(2n+1)!} x^{2n+1}.
\] (15)
The following equation is the generating even terms:
\[
\overline{U}_{2n}(x) = \sum_{l=0}^{n} \binom{2n}{2l} \sum_{j=0}^{l} \binom{2l}{j} (-1)^{j} s(j, k) x^{k+2l},
\]
\[
= \sum_{k=0}^{2n} \sum_{l=0}^{n-k} \binom{2n}{j} (-1)^{j} T(n - l, j, k) x^{k+2l},
\]
where \([x] \) is the greatest integer not exceeding \( x \).
We also derive the generating odd terms:

\[
\tilde{U}_{2n+1}(x) = \sum_{j=0}^{n} \left( \frac{2n+1}{2j+1} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+1}.
\]

\[
= \sum_{k=1}^{n} \sum_{j=0}^{n-k} \left( \frac{2n+1}{2j+1} \right) (-1)^{k-j} \sum_{j=0}^{n-k} \frac{(2j)!}{j!} T(n-l,j) s(j,k-x(k+1)),
\]

(17)

where \( \lfloor x \rfloor \) is the greatest integer not exceeding \( x \).

Thus, we complete the proof of Theorem 2. \( \square \)

Example 3. Let \( n = 1, 2, 3, 4, 5, 6, 7, 8 \), then we can know the following polynomials:

\( \tilde{U}_1(x) = x \),
\( \tilde{U}_2(x) = x^2 - 2x \),
\( \tilde{U}_3(x) = x^3 - 6x^2 \),
\( \tilde{U}_4(x) = x^4 - 12x^3 + 12x^2 + 10x \),
\( \tilde{U}_5(x) = x^5 - 20x^4 + 60x^3 + 50x^2 \),
\( \tilde{U}_6(x) = x^6 - 30x^5 + 180x^4 + 30x^3 - 300x^2 - 182x \),
\( \tilde{U}_7(x) = x^7 - 42x^6 + 420x^5 - 490x^4 + 2100x^3 - 1274x^2 \),
\( \tilde{U}_8(x) = x^8 - 56x^7 + 840x^6 - 6720x^5 - 9460x^4 - 10012x^3 - 6720x^2 + 3304x^3 + 13692x^2 + 6970x \),

(18)

Corollary 4. Let \( n, l \in \mathbb{Z}^+ \) and \( n \geq l \). Then one has

\[
\tilde{U}_{2n}(x) = \sum_{j=0}^{n} \left( \frac{2n}{2j} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+2j},
\]

\[
\tilde{U}_{2n+1}(x) = \sum_{j=0}^{n} \left( \frac{2n+1}{2j+1} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+1}. \]

(19)

Proof. Corollary 4 shows identities of \( \tilde{U}_{2n}(x) \) and \( \tilde{U}_{2n+1}(x) \). The proof of Corollary 4 is contained in Theorem 2. \( \square \)

Setting \( x = 1 \) in Corollary 4, we easily see the following corollary:

Corollary 5. Relation of \( \tilde{U}_{2n}(1) \) and central factorial numbers is shown.

Let \( n, l \in \mathbb{Z}^+ \) and \( n \geq l \). Then one has

\[
\tilde{U}_{2n}(1) = \sum_{j=0}^{n} \left( \frac{2n}{2j} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j),
\]

(20)

Prove. Consider the following:

\[
\tilde{U}_{2n}(1) = \sum_{j=0}^{n} \left( \frac{2n}{2j} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+2j},
\]

\[
= \sum_{j=0}^{n} \left( \frac{2n}{2j} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+2j}.
\]

(21)

We find out the following equation from the above equation by substituting \( x = 1 \):

\[
\tilde{U}_{2n}(1) = \sum_{j=0}^{n} \left( \frac{2n}{2j} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+2j},
\]

(22)

We also can find out \( \tilde{U}_{2n+1}(1) \) by using similar method as above:

\[
\tilde{U}_{2n+1}(1) = \sum_{j=0}^{n} \left( \frac{2n+1}{2j+1} \right) \sum_{j=0}^{n} \frac{(2j)!}{j!} T(n-l,j) \sum_{k=0}^{j} (-1)^{j-k} s(j,k) x^{k+2j},
\]

(23)
If we substitute $x = 1$, then

$$
\mathcal{U}_{2n+1}(1) = \sum_{k=0}^{n} \frac{(2n + 1)}{2n + 1} \sum_{j=0}^{n} \frac{(2j + 1)^{j}T(n - l, j)}{j!} \\
= \sum_{k=0}^{n} \frac{(2n + 1)}{2^{n + 1}} \sum_{j=0}^{n} (-1)^{j} \frac{(2j)!}{j!} T(n - l, j).
$$

(24)

Let $n, k, l \in \mathbb{Z}^+$ and $n \geq k + l - 1$ and

$$
\alpha(2n, k) = \frac{\Gamma(k/2)}{\Gamma(k/2)} (-1)^{k-2} \\
\times \sum_{j=k}^{n} \frac{(2j)^{j}}{2^{j}} T(n - l, j) s(j, k - 2l),
$$

$$
b(2n + 1, k) = \frac{\Gamma(k/2)}{\Gamma(k/2)} \frac{(2n + 1)}{2^{n+1}} (-1)^{k-1} \\
\times \sum_{j=k}^{n} \frac{(2j)^{j}}{2^{j}} T(n - l, j) s(j, k - 2l + 1),
$$

Thus,

$$
\sum_{k=0}^{\infty} \mathcal{U}_{2n}(1) \frac{e^{2n}}{(2n)!} = 1 + \sum_{n=1}^{\infty} \mathcal{U}_{2n+1}(1) \frac{e^{2n+1}}{(2n+1)!},
$$

(29)

We also easily get the following equation by substituting $x = -1$:

$$
\sum_{k=0}^{\infty} \mathcal{U}_{2n+1}(1) \frac{e^{2n+1}}{(2n+1)!} = \sum_{n=0}^{\infty} \mathcal{U}_{2n}(1) \frac{e^{2n}}{(2n)!} \\
= \left( \frac{e^{x} - 1}{e^{x} + e^{x} - 1} \right)^{x}.
$$

(28)

We have to consider odd terms and even terms in (26) and the previous equations, respectively.

Odd terms are in the following form:

$$
\mathcal{U}_{2n+1}(1) = 2 \sum_{k=0}^{n} b(2n + 1, 2k + 1) - 2^{2n+1} - 1.
$$

(31)

and even terms are similar to the way of the proof process of the odd terms. Therefore, we omit the proof process of the even terms.

Theorem 6. Let $n, k \in \mathbb{Z}^+$. Then one gets

$$
\mathcal{U}_{2n+1}(1) = 2 \sum_{k=0}^{n} \alpha(2n, 2k) - 2^{n} + 1.
$$

(27)

Proof. From Definition 1, one easily obtains the following equation:

$$
\sum_{n=0}^{\infty} \mathcal{U}_{2n}(x) \frac{e^{2n}}{(2n)!} = \sum_{n=0}^{\infty} \mathcal{U}_{2n+1}(x) \frac{e^{2n+1}}{(2n+1)!}.
$$

(32)

We have

$$
\sum_{n=0}^{\infty} \mathcal{U}_{2n}(1) \frac{e^{2n}}{(2n)!} = 1 + \sum_{n=1}^{\infty} \mathcal{U}_{2n+1}(1) \frac{e^{2n+1}}{(2n+1)!},
$$

(30)

Thus,

$$
\sum_{n=0}^{\infty} \mathcal{U}_{2n+1}(1) \frac{e^{2n+1}}{(2n+1)!} = 1 + \sum_{n=1}^{\infty} \mathcal{U}_{2n}(1) \frac{e^{2n}}{(2n)!},
$$

(26)

By using $\alpha(2n, k)$ and $b(2n + 1, k)$, we obtain Theorem 6.

Theorem 7. Let $n, k \in \mathbb{Z}^+$ and $k + 1 \leq n$. Then one has

$$
\mathcal{U}_{2n+1}(1) - \mathcal{U}_{n}(1) = \sum_{k=0}^{n} \left( \frac{\Gamma}{k} \right) \left( 1 - 2^{k} \right) \mathcal{U}_{2n+1}(1) - \mathcal{U}_{n}(1).
$$

(32)
Proof. From Definition 1, one easily obtains the following equation:
\[ \sum_{n=0}^{\infty} U_n(1) \frac{\mu^n}{n!} = \left( \frac{e^2 - e - 1}{e + e^{-1}} \right) \cdot \left( \frac{e^z - 1}{e^z + 1} \right). \]

We also easily get the following by using differential, namely,
\[ \sum_{n=1}^{\infty} U_n(1) \frac{\mu^n}{(n-1)!} = -e^2 + 2 \left( \frac{e^z - 1}{e^z + 1} \right)^2. \]

Thus,
\[ \left( e^{2z} - e + 1 \right) \sum_{n=1}^{\infty} U_n(1) \frac{\mu^n}{n!} = -e^2 + 2 \left( \frac{e^z - 1}{e^z + 1} \right)^2. \]

(35)

By simple calculation, we get
\[ \mathcal{U}_{n+1}(1) - 2 \mathcal{U}_n(1) = \sum_{k=0}^{n} \binom{n}{k} \left( 1 - 2^{n-k} \right) \mathcal{U}_{k+1}(1) - \sum_{k=0}^{n} \binom{n}{k} \mathcal{U}_k(1). \]

(39)

Therefore, we proved that
\[ \mathcal{U}_{n+1}(1) - \mathcal{U}_n(1) = \sum_{k=0}^{n} \binom{n}{k} \left( 1 - 2^{n-k} \right) \mathcal{U}_{k+1}(1) - \mathcal{U}_k(1). \]

(40)

3. Zeros of the Polynomials \( \mathcal{U}_n(x) \)

In this section, we investigate the reflection symmetry of the zeros of the polynomials \( \mathcal{U}_n(x) \).

We investigate the beautiful zeros of the polynomials \( \mathcal{U}_n(x) \) by using a computer. We plot the zeros of the polynomials \( \mathcal{U}_n(x) \) for \( n = 20, 30, 40, 50 \) and \( x \in \mathbb{C} \) (Figure 1).

In Figure 1(a), we choose \( n = 20 \). In Figure 1(b), we choose \( n = 30 \). In Figure 1(c), we choose \( n = 40 \). In Figure 1(d), we choose \( n = 50 \).

Throughout the numerical experiments, we can finally conclude that polynomials \( \mathcal{U}_n(x) \) have no \( \text{Re}(x) = 0 \) reflection symmetry analytic complex functions. However, we observe that \( \mathcal{U}_n(x) \) has \( \text{Im}(x) = 0 \) reflection symmetry (see Figures 1, 2, and 3). The obvious corollary is that the zeros of \( \mathcal{U}_n(x) \) will also inherit these symmetries:

\[ \text{if } \mathcal{U}_n(x) = 0, \text{ then } \mathcal{U}_n(x^*) = 0. \]  

(41)

where * denotes complex conjugation (see Figure 1).

Plots of real zeros of \( \mathcal{U}_n(x) \) for \( 1 \leq n \leq 50 \) structure are presented (Figure 2).

Our numerical results for approximate solutions of real zeros of the \( \mathcal{U}_n(x) \) are displayed (Tables 1 and 2).

We observe a remarkably regular structure of the complex roots of the polynomials \( \mathcal{U}_n(x) \). We hope to verify a remarkably regular structure of the complex roots of the polynomials \( \mathcal{U}_n(x) \) (Table 1).

Stacks of zeros of \( \mathcal{U}_n(x) \) for \( 1 \leq n \leq 50 \) from a 3-D structure are presented (Figure 3).

Next, we calculated an approximate solution satisfying \( \mathcal{U}_n(x), \ x \in \mathbb{R} \). The results are given in Table 2.

Finally, we will consider the more general problems. Find the numbers of complex zeros \( \mathcal{C}_{\mathcal{U}_n(x)} \) of \( \mathcal{U}_n(x) \). \( \text{Im}(x) \neq 0 \).

Since \( n \) is the degree of the polynomial \( \mathcal{U}_n(x) \), the number of real zeros \( \mathcal{R}_{\mathcal{U}_n(x)} \) lying on the real plane \( \text{Im}(x) = 0 \) is then
$R_{\alpha_{n,x}} = n - C_{\alpha_{n,x}}$, where $C_{\alpha_{n,x}}$ denotes complex zeros. See Table 1 for tabulated values of $R_{\alpha_{n,x}}$ and $C_{\alpha_{n,x}}$. We plot the zeros of $\overline{U}_n(x)$, respectively (Figures 1–3). These figures give mathematicians an unbounded capacity to create visual mathematical investigations of the behavior of the roots of the $\overline{U}_n(x)$. Moreover, it is possible to create new mathematical ideas and analyze them in ways that generally are not possible by hand. The authors have no doubt that investigation along this line will lead to a new approach employing numerical methods in the field of research of $\overline{U}_n(x)$ to appear in mathematics and physics.

4. Some Relations of Polynomials $\overline{U}_n(x)$ and Euler Numbers

In this section, we find out interesting relations between polynomials $\overline{U}_n(x)$ and Euler numbers. We usually use the values of polynomials $\overline{U}_n(x)$ and Euler polynomials.
Table 2: Approximate solutions of $\overline{U}_n(x) = x \in \mathbb{R}$.

Theorem 8. Let $n \in \mathbb{Z}^+$. Then one has

$$
\frac{2}{3^n} U_n^2(1) = E_n\left(\frac{2}{3}\right) + (-1)^n E_n,
$$

$$
\frac{2}{3^n} U_n^2(2) = E_n\left(\frac{2}{3}\right) + (-1)^n E_n = \left(\frac{2}{3}\right) + (-1)^n E_n,
$$

with the usual convention of replacing $E_n$ by $E_n$.

Proof. By setting $x = 1$ in Definition 1 and using Euler numbers, then we have

$$
\sum_{n=0}^{\infty} \frac{U_n^2(1)}{n!} = \frac{1}{e^t + e^{-t} - 1}
$$

$$
= \frac{1}{1 + e^{-2t}} + \frac{1}{1 + e^{2t}}
$$

$$
= \frac{1}{2} \sum_{n=0}^{\infty} \left( (-1)^n E_n + E_n\left(\frac{2}{3}\right) \right) \frac{e^{nt}}{n!}.
$$

Hence,

$$
\frac{2}{3^n} U_n^2(1) = E_n\left(\frac{2}{3}\right) + (-1)^n E_n.
$$

We also obtain the above equation by taking $x = 2$ and using Euler numbers:

$$
\sum_{n=0}^{\infty} \frac{U_n^2(2)}{n!} = \frac{1}{e^{2t} + e^{-2t} - 1}
$$

$$
= \left(\frac{1}{1 + e^{-2t}} + \frac{1}{1 + e^{2t}} \right) e^{2t}
$$

$$
\times \left(\frac{1}{1 + e^{-2t}} + \frac{1}{1 + e^{2t}} \right)
$$

$$
= \left(\frac{1}{2} \sum_{n=0}^{\infty} \left( (-1)^n E_n + E_n\left(\frac{2}{3}\right) \right) \frac{e^{nt}}{n!} \right) e^{2t}
$$

$$
\times \left(\frac{1}{2} \sum_{n=0}^{\infty} \left( (-1)^n E_n + E_n\left(\frac{2}{3}\right) \right) \frac{e^{nt}}{n!} \right).
$$

(45)
By using Cauchy product in the above equation, we have
\[
\sum_{n=0}^{\infty} U_n(2) \frac{t^n}{n!} = \frac{1}{4} \sum_{n=0}^{\infty} \sum_{k=0}^{n} \binom{n}{k} 3^n \left( (-1)^{k} E_k + E_k \left( \frac{2}{3} \right) \right) \] 
\[
\times \left( (-1)^{n-k} E_{n-k} + E_{n-k} \left( \frac{2}{3} \right) \right) \frac{t^k}{n!}.
\] (46)

By comparing the coefficient of both sides of \( t^n/n! \) and some calculations, we have the following equation:
\[
\frac{2}{3^n} U_n(2) = \left( E_n \left( \frac{2}{3} \right) - E_n \right)^n + 2^{n-1} \left( E_n \left( \frac{2}{3} \right) + (-1)^n E_n \right),
\] (47)

with the usual convention of replacing \( E^n/n! \) by \( E_n \).

Therefore, we computmatized the proof of Theorem 8. \( \square \)

From (26), we can suppose that
\[
U_n(x) = \sum_{k=0}^{n} a(2n,k) x^k + \sum_{k=1}^{n+1} b(2n+1,k) x^k
\] (48)

where
\[
c(n,k) = \begin{cases} 
a(2n,k) & \text{if } n = \text{odd}, 
\frac{b}{b(2n+1,k)} & \text{if } n = \text{even}.
\end{cases}
\] (49)

Therefore, we have Theorem 9.

**Theorem 9.** Let \( n, v_1, \ldots, v_k, k \in \mathbb{N} \). Then one has
\[
k!c(n,k)
\]
\[
= \frac{2^n}{2^k}
\]
\[
\times \sum_{n=0}^{\infty} \left( \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right) \right) \]
\[
\times \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right) \]
\[
\times \left( \frac{v_1! \ldots v_k!}{n!} \right) \].
\] (50)

**Proof.** From Definition 1, we can differentiate the \( k \)-times as follows:
\[
\sum_{n=0}^{\infty} \frac{d^k}{dx^k} U_n(x) \bigg|_{x=0} = \left( \log \frac{e^x}{e^x - e^{-x}} \right)^k.
\] (51)

Here we required that
\[
\log \frac{e^x}{e^x + e^{-x}} = \sum_{n=0}^{\infty} \frac{2^n}{2^k} \left( E_n \left( \frac{1}{3} \right) - E_n \left( \frac{2}{3} \right) + 2E_n \right) \frac{t^n}{n!}.
\] (52)

Hence, we derive that
\[
\sum_{n=0}^{\infty} \frac{d^n}{dx^n} U_n(x) \bigg|_{x=0} = \frac{e^x}{e^x - e^{-x}} \left( \log \frac{e^x}{e^x - e^{-x}} \right)^k.
\] (53)

By comparing the coefficient of both sides of \( t^n/n! \), we have the following equation:
\[
= \frac{2^n}{2^k}
\]
\[
\times \sum_{n=0}^{\infty} \left( \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right) \right) \]
\[
\times \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right) \]
\[
\times \left( \frac{v_1! \ldots v_k!}{n!} \right) \].
\] (54)

From (48), we easily see that
\[
\frac{d^n}{dx^n} U_n(x) \bigg|_{x=0} = k!c(n,k).
\] (55)

Therefore, we clear off the proof of Theorem 9. \( \square \)

**Theorem 10.** Let \( n, v_1, \ldots, v_k, k \in \mathbb{N} \). Then one has
\[
k!c(n,k)
\]
\[
= \frac{n!}{2^n} \sum_{n=0}^{\infty} \left( \left( U_n(x) - 3 \right)^{n-1} - \left( \overline{U_n(x)} - 1 \right)^{n-1} \right) \]
\[
\times \left( \frac{v_1! \ldots v_k!}{n!} \right) \].
\] (56)

**Proof.** This proof can be proved by the similar method of Theorem 9. \( \square \)
We also can derive relation polynomials $\hat{U}_n(x)$ and Euler numbers as follows.

**Theorem II.** Let $n, k \in \mathbb{Z}^+$ and $k + 1 \leq n$. Then one derives

$$
\sum_{k=0}^{n-1} \binom{n-1}{k} (-1)^{n-k-1} \left( 2^{n-k} - 1 \right) \hat{U}_k(1) = \frac{3^{n-1}}{2} \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right). \tag{57}
$$

**Proof.** By the proof of Theorem 9, we can differentiate polynomials $\hat{U}_n(x)$ as follows:

$$
\frac{d}{dt} \left( \log \frac{e^t}{e^t + e^{-t} - 1} \right) = \frac{2e^{-t} - 1}{e^t + e^{-t} - 1} + \frac{e^t}{e^t + e^{-t} - 1} \left( 2e^{-2t} - e^{-t} \right) = \sum_{n=0}^{\infty} \hat{U}_n(1) \frac{n!}{n!} \left( 2 \sum_{k=0}^{n} (-1)^{n-k} \left( 2^{n-k} - 1 \right) \hat{U}_k(1) \right) \frac{n!}{n!}.
$$

By integrating from 0 to $t$, we deduce that

$$
\log \frac{e^t}{e^t + e^{-t} - 1} = \sum_{n=0}^{\infty} \sum_{k=0}^{n} \binom{n}{k} (-1)^{n-k} \left( 2^{n-k} - 1 \right) \hat{U}_k(1) \frac{n!}{n!} \left( \frac{2^{n-k+1}}{n+1} \right). \tag{59}
$$

We already knew from the proof process of Theorem 9 that

$$
\log \frac{e^t}{e^t + e^{-t} - 1} = \sum_{n=0}^{\infty} \frac{3^{n-1}}{2} \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right) \frac{n!}{n!}. \tag{60}
$$

By using the above equation, we can derive that

$$
\sum_{k=0}^{n-1} \binom{n-1}{k} (-1)^{n-k-1} \left( 2^{n-k} - 1 \right) \hat{U}_k(1) = \frac{3^{n-1}}{2} \left( E_{n-1} \left( \frac{1}{3} \right) - E_{n-1} \left( \frac{2}{3} \right) + 2E_{n-1} \right). \tag{61}
$$

Therefore, we completely demonstrated the proof of Theorem II. □
