When are prime formulae characteristic?

D. Della Monica, Reykjavik University

# Characterizing the bridge between the two approaches

## Question:

For what kind of logical specification is it possible to reduce **model checking** to **preorder/equivalence checking**?

## Answer (attempt):

The ones expressed by **consistent and prime formulae** (?)

# Characterizing the bridge between the two approaches

## Question:

For what kind of logical specification is it possible to reduce **model checking** to **preorder/equivalence checking**?

## Answer (attempt):

The ones expressed by **consistent and prime formulae** (?)

## Claim

A formula is characteristic iff it is consistent and prime  
(**characteristic  $\Leftrightarrow$  consistent and prime**)

## Not true in general.

Under which conditions? For which formalisms?

# Logical characterization of preorders

Combination of the two views: logical characterization

A logic  $\mathcal{L}$  **characterizes**  $\leq$  if:

$p \leq q$  iff  $\mathcal{L}(p) \subseteq \mathcal{L}(q)$

# Logical characterization of preorders

## Combination of the two views: logical characterization

A logic  $\mathcal{L}$  **characterizes**  $\leq$  if:

$$p \leq q \text{ iff } \mathcal{L}(p) \subseteq \mathcal{L}(q)$$

## Characteristic formulae

A formula  $\chi(p)$  is a **characteristic formula** for  $p$  with respect to  $\leq$  iff:

$$q \models \chi(p) \text{ iff } p \leq q$$

# Logical characterization of preorders

## Combination of the two views: logical characterization

A logic  $\mathcal{L}$  **characterizes**  $\leq$  if:

$$p \leq q \text{ iff } \mathcal{L}(p) \subseteq \mathcal{L}(q)$$

## Characteristic formulae

A formula  $\chi(p)$  is a **characteristic formula** for  $p$  with respect to  $\leq$  iff:

$$q \models \chi(p) \text{ iff } p \leq q$$

## Consistent and prime formulae

▶  $\phi$  is **consistent** if  $p \models \phi$  for some  $p$

▶  $\phi$  is **prime** if for all  $\phi_1, \phi_2$ :

$$\llbracket \phi \rrbracket \subseteq \llbracket \phi_1 \rrbracket \cup \llbracket \phi_2 \rrbracket$$

implies  $\llbracket \phi \rrbracket \subseteq \llbracket \phi_1 \rrbracket$  or  $\llbracket \phi \rrbracket \subseteq \llbracket \phi_2 \rrbracket$

# Logical characterization of preorders

## Combination of the two views: logical characterization

A logic  $\mathcal{L}$  **characterizes**  $\leq$  if:

$$p \leq q \text{ iff } \mathcal{L}(p) \subseteq \mathcal{L}(q)$$

## Characteristic formulae

A formula  $\chi(p)$  is a **characteristic formula**

for  $p$  with respect to  $\leq$  iff:

$$q \models \chi(p) \text{ iff } p \leq q$$

## Consistent and prime formulae

▶  $\phi$  is **consistent** if  $p \models \phi$  for some  $p$

▶  $\phi$  is **prime** if for all  $\phi_1, \phi_2$ :

$$[[\phi] \subseteq [[\phi_1] \cup [[\phi_2]$$

implies  $[[\phi] \subseteq [[\phi_1]$  or  $[[\phi] \subseteq [[\phi_2]$

# Logical characterization of preorders

## Combination of the two views: logical characterization

A logic  $\mathcal{L}$  **characterizes**  $\leq$  if:

$$p \leq q \text{ iff } \mathcal{L}(p) \subseteq \mathcal{L}(q)$$

## Characteristic formulae

A formula  $\chi(p)$  is a **characteristic formula**

for  $p$  with respect to  $\leq$  iff:

$$q \models \chi(p) \text{ iff } p \leq q$$

## Consistent and prime formulae

▶  $\phi$  is **consistent** if  $p \models \phi$  for some  $p$

▶  $\phi$  is **prime** if for all  $\phi_1, \phi_2$ :

$$[[\phi]] \subseteq [[\phi_1]] \cup [[\phi_2]]$$

implies  $[[\phi]] \subseteq [[\phi_1]]$  or  $[[\phi]] \subseteq [[\phi_2]]$

# Our quest

- ▶ **Question:** How general is this result?

# Our quest

- ▶ **Question:** How general is this result?
- ▶ We use a purely logical approach

# Isolating the logical view from the behavioural one

## The logical formalisms

- ▶  $\mathcal{L}$  is a logic over a set of processes **Proc** (not necessarily LTS)
- ▶ **interpretation** function  $\llbracket - \rrbracket : \mathcal{L} \rightarrow \mathcal{P}(\mathbf{Proc})$

# Isolating the logical view from the behavioural one

## The logical formalisms

- ▶  $\mathcal{L}$  is a logic over a set of processes **Proc** (not necessarily LTS)
- ▶ **interpretation** function  $\llbracket - \rrbracket : \mathcal{L} \rightarrow \mathcal{P}(\mathbf{Proc})$

## The logically defined preorder $\sqsubseteq_{\mathcal{L}}$

- ▶  $p \sqsubseteq_{\mathcal{L}} q$  iff  $\mathcal{L}(p) \subseteq \mathcal{L}(q)$
- ▶  $p \uparrow = \{q \mid p \sqsubseteq_{\mathcal{L}} q\}$

# Our approach

- ▶ To derive some general properties of a logical preorder  $\sqsubseteq_{\mathcal{L}}$  (for a generic logic  $\mathcal{L}$ ) directly
- ▶ If for some behavioural preorder  $\leq$  is characterized by  $\mathcal{L}$  it automatically inherits some properties of  $\sqsubseteq_{\mathcal{L}}$

# Characteristic, prime and consistent formulae (logically)

- ▶  $\phi$  is **characteristic** for  $p$  with respect to  $\sqsubseteq_{\mathcal{L}}$  iff

$$q \in \llbracket \phi \rrbracket \text{ iff } p \sqsubseteq_{\mathcal{L}} q$$

# Characteristic, prime and consistent formulae (logically)

- ▶  $\phi$  is **characteristic** for  $p$  with respect to  $\sqsubseteq_{\mathcal{L}}$  iff

$$q \in \llbracket \phi \rrbracket \text{ iff } p \sqsubseteq_{\mathcal{L}} q$$

(or equivalently iff  $\llbracket \phi \rrbracket = p \uparrow$ )

# Characteristic, prime and consistent formulae (logically)

- ▶  $\phi$  is **characteristic** for  $p$  with respect to  $\sqsubseteq_{\mathcal{L}}$  iff

$$q \in \llbracket \phi \rrbracket \text{ iff } p \sqsubseteq_{\mathcal{L}} q$$

(or equivalently iff  $\llbracket \phi \rrbracket = p \uparrow$ )

- ▶  $\phi (\in \mathcal{L})$  is **prime** ( $\in \mathcal{L}$ ) if the following holds for all  $\phi_1, \phi_2$ :

$$\llbracket \phi \rrbracket \subseteq \llbracket \phi_1 \rrbracket \cup \llbracket \phi_2 \rrbracket \text{ implies } \llbracket \phi \rrbracket \subseteq \llbracket \phi_1 \rrbracket \text{ or } \llbracket \phi \rrbracket \subseteq \llbracket \phi_2 \rrbracket$$

# Characteristic, prime and consistent formulae (logically)

- ▶  $\phi$  is **characteristic** for  $p$  with respect to  $\sqsubseteq_{\mathcal{L}}$  iff

$$q \in \llbracket \phi \rrbracket \text{ iff } p \sqsubseteq_{\mathcal{L}} q$$

(or equivalently iff  $\llbracket \phi \rrbracket = p \uparrow$ )

- ▶  $\phi (\in \mathcal{L})$  is **prime** ( $\in \mathcal{L}$ ) if the following holds for all  $\phi_1, \phi_2$ :

$$\llbracket \phi \rrbracket \subseteq \llbracket \phi_1 \rrbracket \cup \llbracket \phi_2 \rrbracket \text{ implies } \llbracket \phi \rrbracket \subseteq \llbracket \phi_1 \rrbracket \text{ or } \llbracket \phi \rrbracket \subseteq \llbracket \phi_2 \rrbracket$$

- ▶  $\phi$  is **consistent** if  $\llbracket \phi \rrbracket \neq \emptyset$

# Characteristic formulae are prime

## Theorem

If a formula is characteristic then it is prime (and consistent)  
(characteristic  $\Rightarrow$  consistent and prime)

- ▶  $\phi \in \mathcal{L}$  decomposable and prime  $\Rightarrow$  characteristic
- ▶  $\mathcal{L}$  decomposable  $\Rightarrow$  (characteristic  $\Leftrightarrow$  consistent and prime)

# Decomposability

Proof:

Assume  $\phi$  decomposable, consistent and prime

# Decomposability

Proof:

Assume  $\phi$  decomposable, consistent and prime

(by decomposability)  $\llbracket \phi \rrbracket = \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$  where  $p \notin \llbracket \psi \rrbracket$

# Decomposability

Proof:

Assume  $\phi$  decomposable, consistent and prime

(by decomposability)  $\llbracket \phi \rrbracket = \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$  where  $p \notin \llbracket \psi \rrbracket$

$$\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$$

# Decomposability

Proof:

Assume  $\phi$  decomposable, consistent and prime

(by decomposability)  $\llbracket \phi \rrbracket = \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$  where  $p \notin \llbracket \psi \rrbracket$

$$\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$$

$\Rightarrow$  (by primality)  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket$  or  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \psi \rrbracket$

# Decomposability

Proof:

Assume  $\phi$  decomposable, consistent and prime

(by decomposability)  $\llbracket \phi \rrbracket = \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$  where  $p \notin \llbracket \psi \rrbracket$

$$\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$$

$\Rightarrow$  (by primality)  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket$  or  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \psi \rrbracket$

As  $p \notin \llbracket \psi \rrbracket$ , it must be  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket$

# Decomposability

Proof:

Assume  $\phi$  decomposable, consistent and prime

(by decomposability)  $\llbracket \phi \rrbracket = \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$  where  $p \notin \llbracket \psi \rrbracket$

$$\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket$$

$\Rightarrow$  (by primality)  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket$  or  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \psi \rrbracket$

As  $p \notin \llbracket \psi \rrbracket$ , it must be  $\llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket \subseteq \llbracket \chi(p) \rrbracket$

Therefore,  $\llbracket \phi \rrbracket = \llbracket \chi(p) \rrbracket \cup \llbracket \psi \rrbracket = \llbracket \chi(p) \rrbracket$ .

contra-characteristic formula  $\bar{\chi}(p)$   
captures somehow the complement of  $\chi(p)$

# A path to decomposability

contra-characteristic formula  $\bar{\chi}(p)$

captures somehow the complement of  $\chi(p)$

- $\{q \in P \mid q \not\sqsubseteq_{\mathcal{L}} p\} \subseteq \llbracket \bar{\chi}(p) \rrbracket$
- $p \notin \llbracket \bar{\chi}(p) \rrbracket$

# A path to decomposability

contra-characteristic formula  $\bar{\chi}(p)$

captures somehow the complement of  $\chi(p)$

- $\{q \in P \mid q \not\leq_L p\} \subseteq \llbracket \bar{\chi}(p) \rrbracket$
- $p \notin \llbracket \bar{\chi}(p) \rrbracket$

# A path to decomposability

contra-characteristic formula  $\bar{\chi}(p)$

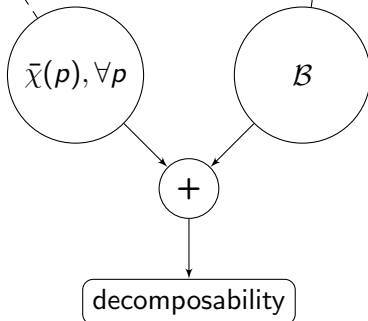

captures somehow the complement of  $\chi(p)$

- $\{q \in P \mid q \not\leq p\} \subseteq \llbracket \bar{\chi}(p) \rrbracket$
- $p \notin \llbracket \bar{\chi}(p) \rrbracket$

finite monotonic  
characterization

$\forall p, \mathcal{B}(p)$ :

- is a finite set of truths  
implying all truths
- respects the preorder

Decomposability

Path to decomposability

Application to semantics in van Glabbeek's spectrum

Conclusions and future work

# Application to semantics in van Glabbeek's spectrum

- ▶ Processes are finite acyclic graphs (finite trees)
- ▶ The semantics preorders are based on *simulation*, *complete simulation*, *ready simulation*, *trace simulation*, *2-nested simulation*, and *bisimulation*.

- ▶ All the preorders are characterized by subsets of the standard finite Hennessy-Milner logic.

- ▶ By checking the properties above we have proven that all these sub-logics are characterized by primality.

de Frutos-Escrig, Gregorio-Rodríguez, Palomino, and Romero-Hernández, *Unifying the Linear Time-Branching Time Spectrum of Process Semantics*, **LMCS 2013**

Decomposability

Path to decomposability

Application to semantics in van Glabbeek's spectrum

Conclusions and future work

# Conclusions

- ▶ **ALWAYS:**  
characteristic  $\Rightarrow$  prime (and consistent)
- ▶ **Proc** is finite and  $\wedge \in \mathcal{L}$ :  
characteristic  $\Leftarrow$  prime and consistent  
(Characterization by primality)
- ▶  $\mathcal{L}$  decomposable:  
characteristic  $\Leftarrow$  prime and consistent  
(Characterization by primality)
- ▶ a simple recipe to decomposability
- ▶ logics that characterize the preorders in branching-time van Glabbeek's spectrum are characterized by primality

# Conclusions

- ▶ **ALWAYS:**  
characteristic  $\Rightarrow$  prime (and consistent)
- ▶ **Proc is finite and  $\wedge \in \mathcal{L}$ :**  
characteristic  $\Leftarrow$  prime and consistent  
(Characterization by primality)
- ▶  **$\mathcal{L}$  decomposable:**  
characteristic  $\Leftarrow$  prime and consistent  
(Characterization by primality)
- ▶ a simple recipe to decomposability
- ▶ logics that characterize the preorders in branching-time van Glabbeek's spectrum are characterized by primality

Moreover

- ▶ We have gained some important insight into the properties of logically characterized preorders

# Future work

- ▶ Use the result of this study to characterize more theories
- ▶ Find other properties that follow directly from a logical characterization of a preorder

# The end

# Thank you!
